

Our handle with a Beating head, allowing the use of an impact absorbing hammer to more easily penetrate soil

The handle with beating head is mainly used when you want to take a sample from harder soils. This can be done, for instance, with a gouge auger or an undisturbed core sampler for harder soils. The beating head is made of high-quality steel and is best and safest to use in combination with an impact absorbing hammer.

Key Features

- Conical thread connection
- Ideal for drilling into harder soils
